Application/Control Number: 10/529,122 Page 2

Art Unit: 1637

1. It is noted that references C7, C8, C10, C13-C16, and C19 on the IDS filed 9/19/05 have not been considered and have been lined through on the attached Form 1449 because copies were not found in the electronic file.

- 2. Claim 1 is objected to because of the following informality: the language "selected to that" in line 10, which may be intended to be "selected so that". Correction is required.
- 3. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 1-24 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

A) These claims are confusing because of the language "nucleic acid hybridization site" in independent claims 1 and 21. The claims include embodiments wherein the first and second probe portions are polypeptides and thus would not bind to nucleic acids via "hybridization"; it is suggested that "hybridization" be replaced in amended claims with "binding", which is applicable in the case of both nucleic acid and polypeptide embodiments.

Application/Control Number: 10/529,122 Page 3

Art Unit: 1637

B) The term "high affinity" in claim 15 is a relative term which renders the claim indefinite. The term "high affinity" is not defined by the claim, the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably apprised of the scope of the invention.

Clarification is required.

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-3, 5-13, 15-17, 19, and 21-23 are rejected under 35 U.S.C. 102(e) as being anticipated by Michnick et al. (US 6,270,964).

These claims are drawn to a method comprising: exposing a target nucleic acid to a first complementation molecule and a second complementation molecule, wherein the first molecule comprises a first polypeptide portion coupled to a first probe portion, and the second molecule comprises a second polypeptide portion coupled to a second probe portion, wherein upon binding of the first and second probe portions to first and second sites in close proximity on the target nucleic acid, the first and second polypeptide portions of the molecules interact and form an assembled complementation complex which is then detected. The broadest claims include embodiments wherein the

Art Unit: 1637

probe portions comprise either nucleic acids such as oligonucleotides, or nucleic acidbinding polypeptides. Claims 21-23 are drawn to a kit comprising a first and second complementation molecule for use in such a method.

Michnick et al. disclose such a method, including embodiments wherein the probe portions comprise nucleic acid-binding polypeptides (see Fig. 1, columns 3-5, column 18, lines 28-30, and columns 23-31). Note especially column 29, line 61 to column 30, line 25, and column 31, lines 2-20, which disclose an embodiment wherein complementation molecules are brought together by attached nucleic acid-binding proteins which simultaneously bind to nearby regions of a target nucleic acid. Michnick et al. also disclose the use of kits in column 37, lines 27-28.

- 5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 4 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Michnick et al. in view of Sodroski et al. (US 5,654,195).

Application/Control Number: 10/529,122

Art Unit: 1637

Claim 4 is drawn to the method as described and rejected above, wherein the first and second polypeptides interact in the complementation complex to form an assembled protein which contains a discontinuous epitope, which may be detected with an antibody. Claim 24 is drawn to a kit comprising such a complementation complex.

The teachings of Michnick et al. are discussed above. While this patent broadly suggests the use of any appropriate complementation complexes which can be detected and distinguished from non-complemented fragments, it does not specifically disclose the use of polypeptide fragments which upon complementation form a discontinuous epitope which can be detected with an antibody.

Sodroski et al. disclose that discontinuous epitopes, and antibodies which recognize them, were known in the prior art (see column 12, lines 41-43).

One of ordinary skill in the art would have been motivated to substitute polypeptides which together form a discontinuous epitope recognized by an antibody, for the enzyme-forming polypeptides in the method of Michnick et al. because such discontinuous epitopes and antibodies were known and available in the prior art (Sodroski et al.), and would have merely provided a predictable and reasonably likely successful alternative detection means (immunodetection) to the enzymatic detection means of Michnick et al. It would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to carry out the claimed methods, and to make and use the claimed kit.

Claim 18 is rejected under 35 U.S.C. 103(a) as being unpatentable over Michnick et al. in view of Lizardi (US 5,854,033).

This claim is drawn to the method as described and rejected above, wherein the target nucleic acid is amplified using rolling circle amplification.

The teachings of Michnick et al. are discussed above. This patent does not specifically disclose rolling circle amplification.

Lizardi discloses rolling circle amplification (see abstract).

One of ordinary skill in the art would have been motivated to use rolling circle amplification to provide target nucleic acid in the method of Michnick et al. because Lizardi disclosed that rolling circle amplification was a good means of providing amplified levels of nucleic acids with multiple benefits/advantages. It would have been prima facie obvious to one of ordinary skill in the art at the time of the invention to carry out the claimed methods.

Claims 1 (oligonucleotide embodiment) and 14 are rejected under 35 U.S.C. 7. 103(a) as being unpatentable over Landegren et al. (US 2002/0064779) in view of Michnick et al.

These claims are drawn to the method as described and rejected above, wherein the first and second probe portions are oligonucleotides (as opposed to polypeptides, which embodiment is addressed above).

Landegren et al. disclose the use of "proximity probes", wherein when first and second binding portions of first and second probes bind to adjacent sites on a target

Application/Control Number: 10/529,122

Art Unit: 1637

molecule, complementary first and second oligonucleotides attached to said first and second binding portions interact via hybridization and are detected (see Figs. 1-3 and page 1). Note that in paragraph 0010 it is disclosed that the binding portion or moiety may be nucleic acids, and in paragraph 0007 it is disclosed that the target analyte may be a nucleic acid.

While Landegren et al. disclose using complementary nucleic acids on the two binding moieties as the basis for detection of proximate binding sites on a target molecule, they do not disclose the use of polypeptide fragments which form a complementation complex as the basis for detection.

As discussed above, Michnick et al. disclose the use of polypeptide fragments which form a complementation complex as the detection means in a method of detecting proximate binding sites in a target molecule using two binding moieties attached to said polypeptide fragments.

One of ordinary skill in the art would have been motivated to substitute polypeptides which together form a complementation complex for the complementary nucleic acids in the method of Landegren et al. because such a complementation complex was disclosed by Michnick et al., and would have merely provided a predictable and reasonably likely successful alternative detection means (protein complementation) to the complementary nucleic acid means of Landegren et al. It would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to carry out the claimed methods.

Application/Control Number: 10/529,122 Page 8

Art Unit: 1637

8. Claim 20 is rejected under 35 U.S.C. 103(a) as being unpatentable over Landegren et al. (US 2002/0064779) in view of Michnick et al., and further in view of Stefano et al. (US 6,287,772).

This claim is drawn to the method as described and rejected above, wherein the first and second probes bind to the same sequence in the target nucleic acid such as would form a triplex.

Neither Landegren et al. nor Michnick et al. disclose a proximity probe wherein the two binding portions bind to the same sequence of a target nucleic acid.

Stefano et al. disclose the use of a nucleic acid proximity probe wherein a detection portion on each of two probe strands interacts with the same sequence of a third strand to form a triple helix or triplex (see Figs. 1-11 and columns 2-15).

One of ordinary skill in the art would have been motivated to substitute a triplex detection means for the adjacent binding site means in the method of Landegren et al. as modified by Michnick et al. because such a triplex detection means was disclosed by Stefano et al., and would have merely provided a predictable and reasonably likely successful alternative detection means involving triplex formation. It would have been prima facie obvious to one of ordinary skill in the art at the time of the invention to carry out the claimed methods.

- 9. No claims are free of the prior art.
- 10. Eisenbeis (US 5,795,718) is made of record as a reference of interest.

Art Unit: 1637

11. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kenneth R. Horlick whose telephone number is 571-272-0784. The examiner can normally be reached on Monday-Thursday 6:30AM-5:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gary Benzion can be reached on 571-272-0782. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
